PT Identifying tumor characteristics in a tissue sample taken from a
 PT patient, involves determining the copy number or expression level of
 PT genes associated with lipid metabolism, synthesis or action.

XX

PS Example 1; Page 82-83; 113pp; English.

XX

CC The present invention describes a method for identifying tumour
 CC characteristics, comprising measuring a copy number or expression level
 CC of at least two genes associated with lipid metabolism, synthesis, or
 CC action in cells from a patient tissue sample, and comparing the results
 CC with a copy number or expression level of the genes in a normal cell.
 CC Also described is an array of nucleic acid polymers immobilised on a
 CC solid support, comprising a solid support, at least two different nucleic
 CC acid polymers which are each specific for a different gene associated
 CC with lipid metabolism, synthesis or action, where each nucleic acid
 CC polymer is located at a predetermined position on the solid support, and
 CC the array comprises nucleic acid polymers which are specific for less
 CC than 100 genes other than the selected genes. The method is useful for
 CC determining tumour characteristics in a tissue sample taken from a
 CC patient. The present sequence represents a human lipid-associated gene
 CC related cDNA sequence, which is used in the exemplification of the
 CC present invention

CC

CC Revised record issued on 11-JUN-2007 : Enhanced with precomputed
 CC information from BOND.

PT Determining whether a patient will respond to treatment with a farnesyl
PT transferase inhibitor, by analyzing the expression of gene that is
PT differentially modulated in the presence of the inhibitor.
XX
PS Disclosure; SEQ ID NO 295; 346pp; English.
XX
CC The invention relates to a method of determining whether a patient will
CC respond to treatment with a farnesyl transferase inhibitor (FTI), by
CC analyzing the expression of gene that is differentially modulated in the
CC presence of an FTI. The method is useful for determining whether a
CC patient will respond to treatment with a FTI such as (B)-6-[amino(4-
CC chlorophenyl)(1-methyl-1H-imidazol-5-yl)methyl]-4-(3-chlorophenyl)-1-
CC methyl-2-(1H)quinolinone, monitoring the therapy of a patient, treating a
CC patient with leukemia with FTI if the analysis indicates that the patient
CC will respond. This sequence corresponds to a gene whose expression may be
CC modulated in the presence of FTI.
CC
CC Revised record issued on 11-JUN-2007 : Enhanced with precomputed
CC information from BOND.

PT Predicting a subject's likelihood of developing insulin resistance,
 PT useful for treating insulin resistance and obesity, comprises determining
 PT in a subject the identity of an allele at position 100 of a specific
 PT sequence.

XX
 PS Disclosure; SEQ ID NO 2; 88pp; English.
 XX

CC This sequence represents the p110-beta gene. p110-beta is a catalytic
 CC subunit of a phosphoinositide 3-kinase, which also comprises a regulatory
 CC subunit of about 85 kD. The p110 protein comprises a kinase domain at the
 CC C-terminus, and a p85 and ras binding domain at the N-terminus. The
 CC method of the invention for predicting a subject's likelihood of
 CC developing insulin resistance comprises determining in a subject the
 CC identity of the nucleotide present at a position corresponding to
 CC position -359 of the p110-beta gene , where the allele comprising the
 CC nucleotide is correlated with an increased or decreased likelihood of
 CC developing insulin resistance. The method of the invention is useful for
 CC treating obesity and insulin resistance and for assessing and conducting
 CC clinical trials of medicaments.

CC
 CC Revised record issued on 11-JUN-2007 : Enhanced with precomputed
 CC information from BOND.

PT underexpression of pool of polynucleotide sequences in colon tissues.

XX
PS Claim 1; SEQ ID NO 831; 154pp; English.

XX
CC The invention describes a method of analyzing (M1) differential gene
CC expression associated with histopathologic features of colorectal
CC disease, comprising detecting overexpression or underexpression of a pool
CC of polynucleotide sequences in colon tissues, the pool selected in each
CC of predefined polynucleotide sequence sets chosen from any one of 644
CC sequence sets comprising combinations of SEQ ID No. 1-1596, fully defined
CC in the specification. Also described are: a polynucleotide library (I)
CC useful for the molecular characterization of a colon cancer, comprising
CC or corresponding to a pool of polynucleotide sequences either
CC overexpressed or underexpressed in colon tissue, the pool corresponding
CC to all or part of the polynucleotide sequence chosen from PS1; and
CC assigning (M2) a therapeutic regimen to patient with histopathological
CC features of colorectal disease, e.g. colon cancer, comprising classifying
CC the patient having a poor prognosis or a good prognosis on the basis of
CC (M1), assigning the patient a therapeutic regimen, the therapeutic
CC regiment comprising no adjuvant chemotherapy if the patient is lymph node
CC negative and is classified as having a good prognosis or comprising
CC chemotherapy if the patient has any other combination of lymph node
CC status and expression profile. (M1) is useful for analyzing differential
CC gene expression associated with histopathologic features of colorectal
CC disease. (M1) is useful for analyzing differential gene expression
CC associated with colon tumors, visceral metastases in colon cancer, lymph
CC node metastases in colon cancer, MSI phenotype in colon cancer, location
CC of primary colorectal carcinoma, in colon cancer, and survival and death
CC of patient in colon cancer, where the analysis comprises detection of
CC overexpression or underexpression of pool of polynucleotide sequences in
CC colon tissue, the pool corresponding to specific combination of

CC polynucleotide sequences from PS1, as given in the specification. (M1) is
 CC useful for detecting, diagnosing, staging, classifying, monitoring or
 CC predicting conditions associated with colorectal cancer. (M1) is useful
 CC for prognosis or diagnosis or colon cancer or for monitoring the
 CC treatment of a patient with colon cancer, which involves implementing
 CC (M1) on nucleic acids from the patient. (M1) is useful for
 CC differentiating a normal cell from a cancer cell, which involves
 CC implementing (M1) on nucleic acids from the cells. (M1) is useful for
 CC selecting appropriate doses and/or schedule of chemotherapeutics and/or
 CC (bio)pharmaceuticals and/or target agents e.g. Irinotecan, 5-fluorouracil
 CC and methotrexate. This sequence represents a polynucleotide identified in
 CC the analysis of differential gene expression associated with
 CC histopathological features of colorectal disease. Note: The sequence data
 CC for this patent is not represented in the printed specification but is
 CC based on sequence information supplied by the European Patent Office.

CC Revised record issued on 11-JUN-2007 : Enhanced with precomputed
 CC information from BOND.

PT Assessing cancer in a human suspected of having cancer, by determining a
 PT non-synonymous, intragenic mutation in a phosphatidylinositol 3-kinase
 PT (PIK3CA) coding sequence in the body sample from a human.

XX
 PS Claim 1; SEQ ID NO 2; 107pp; English.
 XX

CC The invention relates to a method of assessing cancer in a body sample of
 CC a human suspected of having cancer. The method comprises determining a
 CC non-synonymous, intragenic mutation in a phosphatidylinositol 3-kinase
 CC (PIK3CA) coding sequence in the body sample, and identifying the human as
 CC likely to have cancer if a non-synonymous, intragenic mutation in PIK3CA
 CC coding sequence is determined in the body sample. Also described are: (1)
 CC a method of inhibiting progression of a tumor in a human; (2) a method of
 CC identifying candidate chemotherapeutic agents; (3) a method for
 CC delivering an appropriate chemotherapeutic drug to a patient in need; and
 CC (4) a set of one or more primers for amplifying and/or sequencing PIK3CA,
 CC the primers selected from forward primers, reverse primers, or sequencing
 CC primers, where the forward primers are selected from sequences given as
 CC SEQ ID NOs 6-165, the reverse primers are selected from sequences given
 CC as SEQ ID NOs 166-325, and the sequencing primers are selected sequences
 CC given as SEQ ID NOs 326-485 in the specification. The method of the
 CC invention is useful for assessing cancer in a body sample of a human
 CC suspected of having cancer, inhibiting progression of a tumor in a human,
 CC identifying candidate chemotherapeutic agents, and delivering an
 CC appropriate chemotherapeutic drug to a patient in need. This sequence
 CC encodes human PIK3CA.

 XX
 PT Evaluating sensitivity of a tumor cell to a sulfonamide-containing
 PT compound, comprises comparing the expression of specific genes in tumor
 PT cells before and after administration of the compound.
 XX
 PS Claim 1; SEQ ID NO 884; 1405pp; Japanese.
 XX

CC The invention relates to a method of evaluating the sensitivity of a
 CC tumor cell to a sulfonamide-containing compound, by comparing the
 CC expression level of genes in tumor cells obtained from cancer patients
 CC before and after administration of the sulfonamide-containing compound
 CC and determining the tumor cell to be sensitive to the sulfonamide-
 CC containing compound, when the expression amount of genes in the cell is
 CC increased compared with the expression amount before administration
 CC and/or when the expression amount of one or more genes is decreased
 CC compared with the expression amount before administration. The invention
 CC also relates to an assay reagent of RNA comprising an oligonucleotide
 CC complementary to an RNA which is the transcription product of a gene, and
 CC an immunoassay reagent containing the antibody with respect to a protein
 CC which is a translation product of the gene. The expression level of the
 CC gene, which is the RNA transcription product, is measured using a DNA
 CC microarray or by quantitative PCR. The expression level of protein, which
 CC is a translation product of the gene, is measured by an immunochemical
 CC method such as enzyme linked immunosorbent assay (ELISA),
 CC radioimmunoassay (RIA) or Western blotting. The method enables evaluation
 CC of the sensitivity of a tumor cell to a sulfonamide-containing compound.
 CC This sequence represents human tumor cell cDNA used in the scope of the
 CC invention.

CC Revised record issued on 11-JUN-2007 : Enhanced with precomputed
 CC information from BOND.

PT      Recombinant polypeptide(s) - with phosphoinositide-3 kinase activity,
PT      useful for controlling cell proliferation.
XX
PS      Claim 7; Fig 16; 146pp; English.
XX
CC      Southern blot analysis was performed using a bovine cDNA probe contg. a
CC      fragment of a PI3-kinase-encoding sequence and human cDNA isolated from a
CC      cDNA library constructed from mRNA isolated from the human cell line
CC      KGla. Positive clones were sequenced to give the human PI3 kinase p110
CC      sequence shown. This sequence has 95 percent homology with the bovine
CC      sequence. The domain encoding residues 19- 100 of human p110 is
CC      sufficient to encode the kinase which will associate with the p85 kinase
CC      subunit. The gene may be used to provide a protein with PI3 kinase
CC      activity, and is useful for screening for (ant)agonists of PI3 kinase
CC      activity which could be useful for stimulation or inhibition of cell
CC      proliferation and hence prophylaxis or therapy. Platelet or neutrophil
CC      activity or blood glucose levels can be controlled using the kinase. See
CC      also AAQ51155 and AAQ57522-3. (Updated on 25-MAR-2003 to correct PN
CC      field.) (Updated on 25-MAR-2003 to correct PI field.)

 PT Assessing cancer in a human suspected of having cancer, by determining a
 PT non-synonymous, intragenic mutation in a phosphatidylinositol 3-kinase
 PT (PIK3CA) coding sequence in the body sample from a human.
 XX
 PS Disclosure; SEQ ID NO 1; 107pp; English.
 XX
 CC The invention relates to a method of assessing cancer in a body sample of
 CC a human suspected of having cancer. The method comprises determining a
 CC non-synonymous, intragenic mutation in a phosphatidylinositol 3-kinase
 CC (PIK3CA) coding sequence in the body sample, and identifying the human as
 CC likely to have cancer if a non-synonymous, intragenic mutation in PIK3CA
 CC coding sequence is determined in the body sample. Also described are: (1)
 CC a method of inhibiting progression of a tumor in a human; (2) a method of
 CC identifying candidate chemotherapeutic agents; (3) a method for
 CC delivering an appropriate chemotherapeutic drug to a patient in need; and
 CC (4) a set of one or more primers for amplifying and/or sequencing PIK3CA,
 CC the primers selected from forward primers, reverse primers, or sequencing
 CC primers, where the forward primers are selected from sequences given as
 CC SEQ ID NOs 6-165, the reverse primers are selected from sequences given
 CC as SEQ ID NOs 166-325, and the sequencing primers are selected sequences
 CC given as SEQ ID NOs 326-485 in the specification. The method of the
 CC invention is useful for assessing cancer in a body sample of a human
 CC suspected of having cancer, inhibiting progression of a tumor in a human,
 CC identifying candidate chemotherapeutic agents, and delivering an
 CC appropriate chemotherapeutic drug to a patient in need. This sequence
 CC encodes human PIK3CA.

New nucleic acid, and derived proteins, useful for diagnosis of bronchial cancer and in screening for therapeutic and diagnostic agents.

Claim 1; SEQ ID NO 157; 1381pp; German.

This invention relates to a novel isolated nucleic acid associated with bronchial cancer comprising 489 defined sequences given in the specification. The invention may be useful for the production of compounds with a cytostatic activity through the inhibition of expression or activity of tumour-associated proteins. The novel DNA sequences and the proteins/peptides encoded by them are used for detecting bronchial cancer or determining the risk of developing it and to screen for specific binding partners of the DNA or protein sequences, where the binding partners are potentially useful as agents for treating or diagnosing bronchial cancer. The DNA or protein sequences can also be used for prognosis, detection of metastases and for secondary treatment (of tumours that have been stabilised or are no longer detectable). Detecting abnormal expression of the DNA sequences provides early diagnosis of bronchial cancers. The present sequence is that of a novel bronchial cancer-associated human gene sequence of the invention.

PT New nucleotide array comprises polynucleotide probes complementary to, or
PT fragments of, Cynomolgus monkey genes, useful for detecting changes in
PT gene expression upon administration of a therapeutic agent.
XX
PS Claim 18; SEQ ID NO 46524; 33pp; English.
XX
CC The new invention relates to a nucleotide array for detecting changes in
CC gene expression upon administration of a therapeutic agent. The
CC microarray has polynucleotide probes complementary to, or fragments of,
CC Cynomolgus monkey genes, where each polynucleotide probe is immobilized
CC to a discrete and known spot on a solid support. The polynucleotide
CC probes are complementary to, or fragments of, any portion of an ortholog
CC of a human gene, preferably a Tox gene. The probes are any of SEQ ID NO.
CC 8882-9186. The probes are also complementary to, or fragments of, any
CC portion of any of SEQ ID NO. 1-8881 or 9187-18598. The nucleotide array
CC has at least one probe complementary to, or a fragment of, any portion of
CC any human gene, where the probe from a human gene is any of SEQ ID NO.
CC 43226-48714, or is complementary to, or a fragment of, any portion of any
CC of SEQ ID NO. 43450-48714. The array has at least one probe complementary
CC to, or a fragment of, any portion of any Rhesus monkey gene, where the
CC probe from a Rhesus monkey gene is any of SEQ ID NO. 35841-36074, or is
CC complementary to, or a fragment of, any portion of any of SEQ ID NO.
CC 18599-35840 or 36075-43225. It also has at least one probe complementary
CC to, or a fragment of, any portion of a Rhesus monkey gene and at least
CC one probe complementary to, or a fragment of, any portion of any human
CC gene. The nucleotide array is useful for detecting changes in gene
CC expression upon administration of a therapeutic agent. It can be used for
CC characterizing the actions, targets, and toxicities of therapeutic agents
CC in primates, e.g. a human, a Cynomolgus monkey, or a Rhesus monkey. This
CC sequence is a DNA fragment of a human Tox gene.

 PT Screening for adenoma in a subject, comprises testing a sample for the
 PT presence of each of a panel of genetic markers, where the panel is more
 PT than 60% informative for adenoma.
 XX
 PS Disclosure; SEQ ID NO 7; 79pp; English.
 XX
 CC The invention relates to a method for screening a subject for the
 CC presence of adenoma. The method comprises interrogating a sample from the
 CC subject for each of a panel of genetic markers, where the panel is more
 CC than 60% informative for adenoma, and where the presence of one or more
 CC of the markers is indicative of adenoma. Also described are: (1) a method
 CC of detecting indicia of adenoma, by assaying a sample from a subject for
 CC the presence of one or more genetic abnormalities from a group of genetic
 CC abnormalities that is more than 60% informative for adenoma; (2) a method
 CC of detecting adenoma in a subject, by performing an assay on a sample
 CC from the subject that is more than 60% informative for adenoma; and (3) a
 CC kit comprising a group of oligonucleotides, where each oligonucleotide is
 CC adapted for interrogating a genetic locus for the presence of a marker
 CC from a panel that is at least 60% informative for adenoma. The methods
 CC and kit of the invention are useful for screening for adenoma in a
 CC subject. The adenoma is especially a colonic and/or invasive adenoma. The
 CC methods can detect adenoma at an early stage with a high level of
 CC confidence, increasing the chances of successful treatment. This sequence
 CC represents a human DNA sequence that can be used as a genetic marker in
 CC the method of the invention.
 CC
 CC Revised record issued on 11-JUN-2007 : Enhanced with precomputed

CC information from BOND.

 PT In vitro diagnosis of breast cancer comprises extracting biological
 PT material of biological sample, contacting biological material with
 PT specific reagents of target genes and determining target gene expression.
 XX
 PS Example 2; SEQ ID NO 97; 305pp; French.
 XX
 CC The invention describes a method for in vitro diagnosis of breast cancer
 CC in a patient susceptible to be affected by breast cancer, comprising:
 CC extracting nucleic acid from a biological sample taken from the patient;
 CC contacting the nucleic acid with at least 8 hybridization probes for
 CC detection of target genes chosen from SEQ ID Nos. 1 to 8 or 10 probes for
 CC detection of target genes chosen from SEQ ID Nos. 1, 2, 4, 6, 13, 14, 26,
 CC 69, 81 and 105; and determining the expression of the target genes. The
 CC invention also includes: a support, such as a biochip, comprising at
 CC least 8 or 10 hybridization probes mentioned above; and a diagnosis kit
 CC for breast cancer comprising the support. The method, biochip and kit are
 CC useful for the in vitro diagnosis of breast cancer. This sequence is a
 CC breast cancer-associated gene.
 CC
 CC Revised record issued on 11-JUN-2007 : Enhanced with precomputed
 CC information from BOND.

PT New isolated polynucleotide comprises PRO polynucleotide or fragment
PT comprising a nucleotide variation, useful for detecting nucleotide
PT variations for diagnosing and treating tumors.
XX
PS Claim 2; SEQ ID NO 30; 55pp; English.
XX
CC The present invention relates to a novel isolated polynucleotide
CC comprising a PRO polynucleotide or its fragment. The PRO polynucleotide
CC or its fragment comprises a nucleotide variation at a nucleotide position
CC given in the specification. A nucleotide variation refers to a change in
CC a nucleotide sequence (e.g., an insertion, deletion, inversion, or
CC substitution of one or more nucleotides, such as a single nucleotide
CC polymorphism (SNP)) relative to a reference sequence (e.g., a wild type
CC sequence). A nucleotide variation may be a somatic mutation or a germline
CC polymorphism. The present invention provides: (i) an allele-specific

CC oligonucleotide that hybridizes to a region of a PRO polynucleotide
 CC comprising a nucleotide variation at a nucleotide position, or its
 CC complement; (iii) a kit comprising the oligonucleotide and an enzyme;
 CC (iii) a microarray comprising the oligonucleotide; (iv) a method for
 CC detecting the absence or presence of the variation at a nucleotide
 CC position; (v) a method for amplifying a nucleic acid comprising the
 CC nucleotide variation; (vi) a method for determining the genotype of a
 CC biological sample (e.g. non-small cell lung carcinoma sample) from a
 CC mammal; (vii) a method for classifying a tumor in the mammal; and (viii)
 CC a method for predicting whether a tumor (e.g. non-small cell lung
 CC carcinoma) will respond to a therapeutic agent that targets a PRO or a
 CC PRO polynucleotide, comprises determining whether the tumor comprises a
 CC variation in a PRO or PRO polynucleotide, where the presence of a
 CC variation indicates that the tumor will respond to the therapeutic agent.
 CC The method of detecting the absence or presence of the nucleotide
 CC variation comprises: (a) contacting the suspected nucleic acid with the
 CC allele-specific oligonucleotide that is specific for the nucleotide
 CC variation, under conditions suitable for hybridization of the
 CC oligonucleotide to the nucleic acid; and (b) detecting the absence or
 CC presence of allele-specific hybridization. The method of amplifying the
 CC nucleic acid comprising the nucleotide variation comprises: (a)
 CC contacting the nucleic acid with a primer that hybridizes to the nucleic
 CC acid at 3' of the nucleotide variation; and (b) extending the primer to
 CC generate an amplification product comprising the nucleotide variation.
 CC The isolated polynucleotide is used for detecting nucleotide variations.
 CC The methods are used for diagnosing and treating tumors. The present
 CC sequence is a human PRO polynucleotide sequence used in the invention.
 CC
 CC Revised record issued on 18-JUN-2008 : Enhanced with precomputed
 CC information from BOND.

XX

PT New polynucleotide, useful for determining the genotype of a sample from
PT a mammal, for classifying a tumor in a mammal or for predicting whether a
PT tumor will respond to a therapeutic agent that targets a PRO polypeptide
PT or polynucleotide.

XX

PS Claim 2; SEQ ID NO 53; 98pp; English.

XX

CC The present invention relates to novel isolated polynucleotides. An
CC isolated polynucleotide comprises: (a) a PRO polynucleotide or its
CC fragment that is at least about 10 nucleotides in length or that
CC comprises a nucleotide variation at a nucleotide position given in the
CC specification, or (b) its complement. These variations provide biomarkers
CC for cancer and/or predisposition to tumorigenesis or tumor promotion. The
CC present invention provides: (1) a kit comprising the oligonucleotide and
CC at least one enzyme; (2) a microarray comprising the oligonucleotide; (3)
CC a method for detecting the absence or presence of a nucleotide variation
CC at a nucleotide position given in the specification, which comprises
CC contacting the nucleic acid suspected of comprising the nucleotide
CC variation with an allele-specific oligonucleotide that is specific for
CC the nucleotide variation and detecting the absence or presence of allele-
CC specific hybridization; (4) a method for amplifying a nucleic acid
CC comprising a nucleotide variation at a nucleotide position given in the
CC specification; (5) a method for determining the genotype of a tumor
CC sample from a mammal; (6) a method for classifying a tumor in a mammal by
CC detecting the presence of a variation in a PRO or PRO polynucleotide in a
CC biological sample derived from the mammal; and (7) a method for
CC predicting whether a tumor will respond to a therapeutic agent that
CC targets a PRO or a PRO polynucleotide by determining whether the tumor
CC comprises a variation in a PRO or PRO polynucleotide, where the presence
CC of a variation indicates that the tumor will respond to the therapeutic
CC agent. The method of amplifying a nucleic acid comprising a nucleotide
CC variation comprises: (a) contacting the nucleic acid with a primer that
CC hybridizes to the nucleic acid at a sequence 3' of the nucleotide
CC variation, and (b) extending the primer to generate an amplification
CC product comprising the nucleotide variation. The variations disclosed in
CC the invention are useful in methods and compositions related to cancer
CC diagnosis and therapy. The present sequence is an isolated polynucleotide
CC of the invention.
